

## Modified Phase II ESA – Oil leak

Building 1206  
East Marginal Way  
Seattle, WA

### Scope of Work

1. Visit site and perform plan review of “as-built” drawings and any previous studies that were conducted
2. Use the Ground penetrating radar (GPR) and a magnetometer survey of the SW corner of the Building 1206 to determine best location for installing boreholes
3. Install six to eight access holes in the buildings concrete floor slab to access the building’s subsurface..
4. Collect samples and analyze the subsurface samples to determine the extent of the petroleum hydrocarbon release beneath the SW quarter of building 1206
5. EHSI will prepare a report detailing the results of the Modified Phase II ESA together with a cost estimate to remediate the petroleum hydrocarbon release.
